

Figure S1. Nucleolar localization of NPs in different strain-infected cells

Subcellular localization of NPs in mock-infected or influenza virus-infected (MOI=5) cells. Viral strains are labelled at the top of the images. NP and nucleolin were immuno-stained after protease treatment of fixed and permeabilized cells at 4.5–6 hpi. Nuclei are marked by dashed circles. Scale bars, 20 μ m. Representative images from duplicate wells are shown.
